For this project you will be researching and writing a 4 page (minimum) double spaced 12 font report on an element (assigned to you or your choice depending on the project). A cover sheet and reference table with the sources used must also be included. To complete this research, you will be required to use at least 4 sources. The information used should be from data base sources or other reliable published works. The information presented in this paper must be cited, and citations must be made using APA format. If you are not familiar with this citation method, the library can be of assistance, and some good information exists on the internet to help with this.

This report should contain the following:

- An introduction of the element including the physical properties associated with it, where it is found, and any other relevant periodic information.
- History of the element, discovery information, etc.
- Common uses of the element and its economical importance/value if applicable
- Proper use of the English language

This report will count as a lab (or extra credit), and has a total point value of 25 pts associated with it (5pts for each of the required items and 5pts for following APA formatting). The due date for this report is final! No late reports will be accepted! For an extra credit report, it will be due on the date when the last exam is given and will be turned in with your exam.
